SUMMARY

Independent smart-contract security researcher. 11 vulnerabilities privately disclosed across EVM launchpads, CDP/stablecoin engines and reward systems — 7 High severity. One confirmed production fix shipped by the vendor with no user funds lost. Verification is fork and `eth_call` only, with reproducible Foundry PoCs and honest impact bounds.

TECHNICAL SKILLS - SECURITY

- **Languages:** Solidity, Rust, Python, TypeScript, Bash
- **Security tools:** Foundry (forge/cast/anvil), fork PoC harnesses, Slither, Echidna, Sourcify, Blockscout API, bytecode/selector analysis
- **Blockchain:** EVM internals (CREATE prediction, nonce/revert semantics, `sload`), Uniswap V2/V3/V4 core + periphery, bonding curves, LP locking, CDP collateral & liquidation, oracle quorum models, flash-loan manipulation
- **Methods:** smart-contract auditing, vulnerability research, severity bounding, access-control & DoS review, threat modeling, static/dynamic analysis, reversing unverified bytecode, responsible disclosure

SECURITY RESEARCH PROJECTS

Openfair — V3 graduation pool squat (High). Pre-created pool at an attacker-set price absorbed the ~5 ETH community raise; the pad never validated `sload`. **Disclosed privately — vendor shipped v2.0, retroactively protected all earlier launches, zero user funds lost.**

The Index — Flash-loanable distribution snapshot (High). Payout snapshot read live `balanceOf` with no checkpoint or hold period, letting a borrowed position collect a whale's share of every cycle. Proven with a Foundry PoC mirroring production logic.

Merry Men / PumpClaw — V4 pre-init factory freeze (High). `initializePool` soft-fails on an existing pool; pre-initing the factory's next predicted CREATE address bricked `createToken` permanently, since the revert rolls the nonce back. Verified on an Anvil fork.

StockDotFun — V4 pre-init graduation freeze (High). Gas-only, zero-inventory pool squat forced `MIGRATION_FAILED`, trapping a launch's full ~4.4 ETH raise with no in-protocol recovery path.

HoodRich / RobinPump — Zero-min V2 migration (High). Graduation deposited the raise with `amountTokenMin/amountETHMin` both 0. Found by differential review — a sibling factory in the same codebase already checked `sload`, and a competitor used 95% mins for the identical call.

Also disclosed: Robinlaunch V3 pool squat and Robinfun pair-pollution freeze (both High); xStocks CDP single-reporter oracle trust flaw and unminted borrow-fee debt; HoodCash permanently burned reward accrual; SLVR delegate claim redirect (Medium).

RESEARCH & TOOLS

- **Bug-hunt toolkit** — 10-step gate-driven pipeline in Bash/Python: RPC ground-truth gating, creator trace + frontend bundle grep for core discovery, surface mapping (codesize/Sourcify/selectors), unauthenticated `eth_call` auth triage, Foundry fork-PoC scaffolding, report and disclosure generators, selftest harness.
- **Bughunt playbook** (`iykes-web3-bughunt-skill`) — the audit method the toolkit implements: intake, per-step decision gates, PoC and report templates, "kill your own finding" severity discipline, fork-only rules of engagement.
- **Ecosystem sweep** — ~30 Robinhood Chain protocols triaged, with negative results held to the same standard as positives.

PROFESSIONAL EXPERIENCE

Independent Security Researcher | 2026 - Present

- 11 findings across launchpads, CDP engines, mining pools and distribution systems; every report states an explicit impact bound and what the finding is *not*.
- Specialized in AMM pool-initialization attack surface — a bug class recurring across nearly every bonding-curve launchpad audited.

Freelance Blockchain Developer, CribX | Aug 2026 - Present

- Audited and completed a multi-chain deposit system (BTC/ETH/SOL/USDT/USDC) in a NestJS/Prisma/BullMQ backend; hardened the credit path against replay-driven double-crediting within BitGo and Tatum trust boundaries.

Selected secure protocol work — Covenant, attestation-gated treasury on Stacks (**2nd place, FlowVault hackathon**); Skimflow, x402 micropayment settlement with USDC on Arc; Freelance Escrow in Rust/Stylus; technical audit of CredChain.

EDUCATION

B.Eng. Software Engineering, Federal University of Technology Owerri — 2023-2028 (in progress)
